## Supplemental Tables and Figures

### Methods

Discuss here how the experiment was designed and how we needed three greenhouses to perfectly test our question about growing season length and end of season growth.

### Data analysis and model equations

- False spring treatment is written as ‘tx’ in the equation below and chilling was split into two binary predictors: ‘chill1’, which is denoted as ‘0’ for 4 weeks of chilling or ‘1’ for 6 weeks of chilling and ‘chill2’ which is ‘1’ for 8 weeks of chilling:

$$y_i = \alpha_{species[i]} + \beta_{tx_{species[i]}} X_{tx} + \beta_{chill1_{species[i]}} X_{chill1} + \beta_{chill2_{species[i]}} X_{chill2} + \beta_{txchill1_{species[i]}} X_{txchill1} + \beta_{txchill2_{species[i]}} X_{txchill2} + \epsilon_i \quad (1)$$

$$\epsilon_i \sim N(0, \sigma_y)$$

- The  $\alpha$  and each of the five  $\beta$  coefficients are modeled at the species level, as follows:

$$\begin{aligned} \alpha_{species} &\sim N(\mu_\alpha, \sigma_\alpha) \\ \beta_{tx_{species}} &\sim N(\mu_{tx}, \sigma_{tx}) \\ \beta_{chill1_{species}} &\sim N(\mu_{chill1}, \sigma_{chill1}) \\ \beta_{chill2_{species}} &\sim N(\mu_{chill2}, \sigma_{chill2}) \\ \beta_{txchill1_{species}} &\sim N(\mu_{txchill1}, \sigma_{txchill1}) \\ \beta_{txchill2_{species}} &\sim N(\mu_{txchill2}, \sigma_{txchill2}) \end{aligned}$$

- 21 3. where  $i$  represents each unique observation,  $species$  is the species,  $\alpha$  represents the intercept,  $\beta$  terms  
 22 represent slope estimates, and  $y$  is the phenology or growth measurement.
- 23 4. For the shoot apical meristem model, we used a Bernoulli distribution, which is modeled as:

$$\begin{aligned}
 y_i &\sim \text{Binomial}(1, p) \\
 \text{logit}(p) &= \alpha_{species[i]} + \beta_{tx_{species[i]}} X_{tx} + \beta_{chill1_{species[i]}} X_{chill1} + \beta_{chill2_{species[i]}} X_{chill2} \\
 &\quad + \beta_{txchill1_{species[i]}} X_{txchill1} + \beta_{txchill2_{species[i]}} X_{txchill2} + \epsilon_i
 \end{aligned} \tag{2}$$

- 24 5. The  $\alpha$  and each of the five  $\beta$  coefficients are modeled the same as the other models:

$$\begin{aligned}
 \alpha_{species} &\sim N(\mu_\alpha, \sigma_\alpha) \\
 \beta_{tx_{species}} &\sim N(\mu_{tx}, \sigma_{tx}) \\
 \beta_{chill1_{species}} &\sim N(\mu_{chill1}, \sigma_{chill1}) \\
 \beta_{chill2_{species}} &\sim N(\mu_{chill2}, \sigma_{chill2}) \\
 \beta_{txchill1_{species}} &\sim N(\mu_{txchill1}, \sigma_{txchill1}) \\
 \beta_{txchill2_{species}} &\sim N(\mu_{txchill2}, \sigma_{txchill2})
 \end{aligned}$$

Figure S1: Understanding rank order of leafout across all species using (a) mean trends and (b) raw estimates.
