## Supplemental Materials and Methods: Data analysis and model equations

Using Bayesian hierarchical models, we estimated the effects of chilling duration, false spring treatment and all two-way interactions as predictors with species modeled hierarchically as grouping factors. False spring treatment is written as 'tx' in the equation below and chilling was split into two binary predictors: 'chill1', which is denoted as '0' for 4 weeks of chilling or '1' for 6 weeks of chilling and 'chill2' which is '1' for 8 weeks of chilling:

$$y_{i} = \alpha_{species[i]} + \beta_{tx_{species[i]}} X_{tx} + \beta_{chill1_{species[i]}} X_{chill1} + \beta_{chill2_{species[i]}} X_{chill2} + \beta_{txchill1_{species[i]}} X_{txchill1} + \beta_{txchill2_{species[i]}} X_{txchill2} + \epsilon_{i}$$

$$, \tag{1}$$

$$\epsilon_i \sim N(0, \sigma_u)$$

The  $\alpha$  and each of the five  $\beta$  coefficients are modeled at the species level, as follows:

$$\begin{split} \alpha_{species} &\sim N(\mu_{\alpha}, \sigma_{\alpha}) \\ \beta_{tx_{species}} &\sim N(\mu_{tx}, \sigma_{tx}) \\ \beta_{chill1_{species}} &\sim N(\mu_{chill1}, \sigma_{chill1}) \\ \beta_{chill2_{species}} &\sim N(\mu_{chill2}, \sigma_{chill2}) \\ \beta_{txchill1_{species}} &\sim N(\mu_{txchill1}, \sigma_{txchill1}) \\ \beta_{txchill2_{species}} &\sim N(\mu_{txchill2}, \sigma_{txchill2}) \end{split}$$

where i represents each unique observation, species is the species,  $\alpha$  represents the intercept,  $\beta$  terms represent

slope estimates, and y is the phenology or growth measurement.

23 For the shoot apical meristem model, we used a Bernouilli distribution, which is modeled as:

$$y_{i} \sim Binomial(1, p)$$

$$logit(p) = \alpha_{species[i]} + \beta_{tx_{species[i]}} X_{tx} + \beta_{chill_{species[i]}} X_{chill_{1}} + \beta_{chill_{species[i]}} X_{chill_{2}}$$

$$+ \beta_{txchill_{species[i]}} X_{txchill_{1}} + \beta_{txchill_{species[i]}} X_{txchill_{2}} + \epsilon_{i}$$

$$,$$

$$(2)$$

The  $\alpha$  and each of the five  $\beta$  coefficients are modeled the same as the other models:

$$\begin{split} \alpha_{species} &\sim N(\mu_{\alpha}, \sigma_{\alpha}) \\ \beta_{tx_{species}} &\sim N(\mu_{tx}, \sigma_{tx}) \\ \beta_{chill1_{species}} &\sim N(\mu_{chill1}, \sigma_{chill1}) \\ \beta_{chill2_{species}} &\sim N(\mu_{chill2}, \sigma_{chill2}) \\ \beta_{txchill1_{species}} &\sim N(\mu_{txchill1}, \sigma_{txchill1}) \\ \beta_{txchill2_{species}} &\sim N(\mu_{txchill2}, \sigma_{txchill2}) \end{split}$$

- 25 Model estimates for the shoot apical meristem model were modeled on the logit scale (shown in all tables)
- 26 and were converted to probability percentages in all figures for easier interpretation by following the 'divide
- by four' rule (Gelman & Hill, 2006).

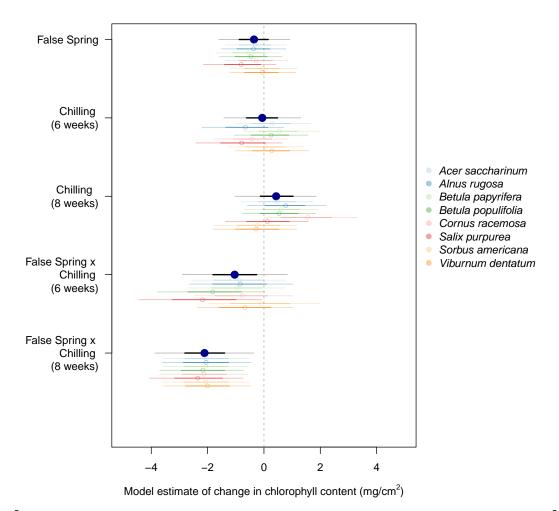

Figure S2: Effects of false spring treatment, six weeks of chilling and eight weeks of chilling on chlorophyll content. Larger, blue dots represent overall estimates across all species, while smaller dots are estimates for each species. Dots and thin lines show means and 90% uncertainty intervals and thicker lines show 50% uncertainty intervals.
